Inhand InRouter 900 Industrial 4G Router Vulnerabilities

Description

Inhand InRouter 900 is a Industrial 4G Router. Remote code execution exists in InRouter 900, before firmware version 1.0.0.r11700, attackers can execute arbitrary commands via a crafted packet.

Vulnerabilities found by reversing */usr/bin/httpd*.

1.Remote Code Execution

URL: http://ip/wizards-ipsec-expert.jsp

In function ***sub_17C08***, the handler ***get_cgi_from_memory*** can get data from front-end user input, v3 is filename. In line 58, variable **s** composes v3 and other text via ***snprintf***.

```
39  v2 = (const char *)get_cgi_from_memory("type");
40  v3 = (char *)get_cgi_from_memory("filename");
41  if ( a1 )
42  {
43    if ( !strcmp(a1, "python.cgi") )
44      a1 = (const char *)get_cgi_from_memory("pyapp");
45    else
46      a1 = 0;
47  }
48  if ( !v2 || !*v2 )
49  {
50    syslog(7, "unknown upload type!");
51    return sub_11AAC("error.jsp");
52  }
53  if ( !v3 || !*v3 )
54  {
55    syslog(7, "unknown upload filename!");
56    return sub_11AAC("error.jsp");
57  }
58  snprintf(s, 0x400u, "sed 's/\r//g' -i %s", v3);
59  if ( !strcasecmp(v2, "config") )
```

In line 181,if ***v2*** equal ***ipsec_conf***, then ***s*** will execute. Remote code execution triggered.

```
181  if ( !strcasecmp(v2, "ipsec_conf") )
182  {
183    system(s);
184    v18 = "/tmp/ipsec.conf";
185    syslog(7, "import ipsec.conf...");
186    rename(v3, "/tmp/ipsec.conf");
187    v19 = f_size("/tmp/ipsec.conf");
188    sub_168B8("infomsg.upload_ok");
189    if ( v19 <= 0x3C00 )
190    {
191      v20 = "/var/backups/ipsec.conf";
192      v21 = "/tmp/ipsec.conf";
```

PoC:

Visit following page, and capture packet.

Modify packet like this and forward:

2. Remote Code Execution

URL:http://IP/setup-openvpn-clientN.jsp

The similar vulnerability exists in line 164 when type equal ***config_ovpn***.

```
161   }
162   if ( !strcasecmp(v2, "config_ovpn") )
163   {
164     system(s);
165     v13 = "/tmp/tmp.ovpn";
166     syslog(7, "import ovpn config...");
167     rename(v3, "/tmp/tmp.ovpn");
168     v14 = f_size("/tmp/tmp.ovpn");
169     if ( v14 > 0x3C00 )
170       goto LABEL_46;
171 LABEL_43:
```

3.Remote Code Execution

URL:http://IP/wizards-ipsec-expert.jsp

The similar vulnerability exists in line 164 when type equal ***ipsec_secrets***.

```
204   if ( !strcasecmp(v2, "ipsec_secrets") )
205   {
206     system(s);
207     v18 = "/tmp/ipsec.secrets";
208     syslog(7, "import ipsec.secrets...");
209     rename(v3, "/tmp/ipsec.secrets");
210     v22 = f_size("/tmp/ipsec.secrets");
211     sub_168B8("infomsg.upload_ok");
212     if ( v22 <= 0x3C00 )
213     {
214       v21 = "/tmp/ipsec.secrets";
215       v20 = "/var/backups/ipsec.secrets";
216       goto LABEL_57;
```

4.Remote Code Execution

URL:http://IP/status-python-sdk.jsp

The similar vulnerability exists in line 164 when ***type*** equal ***python-lib***.

```
if ( strcasecmp(v2, "python-lib") )
{
  if ( !strcasecmp(v2, "python-cfg") )
  {
    syslog(6, "import python lib file:%s", v3);
    v5 = f_size(v3);
    if ( (unsigned int)(v5 - 1) > 0x2CFFFFE )
    {
      sub_168B8("errmsg.filesize");
      sub_105C4("info");
      syslog(6, "import file: %s is too big %ld!", v3, v5);
      goto LABEL_65;
    }
    if ( a1 )
    {
      snprintf(v29, 0x80u, "/var/app/cfg/%s", a1);
      v6 = opendir(v29);
      if ( v6 )
      {
        closedir(v6);
      }
      else if ( mkdir(v29, 0x1FFu) )
      {
        v25 = *__errno_location();
        v26 = strerror(v25);
        syslog(3, "creat %s failed(%d:%s)", v29, v25, v26);
        unlink(v3);
        sub_11AAC("error.jsp");
      }
      v7 = _xpg_basename(v3);
      syslog(6, "get file path %s/%s", v29, v7);
      snprintf(v28, 0x80u, "rm -rf /var/app/cfg/%s/*", a1);
      system(v28);
      v36 = 0;
      v33 = "-af";
      v32 = "cp";
      v34 = v3;
      v35 = v29;
```

5.Remote Code Execution

URL:[***http://IP/cert-mgr.jsp***](http://IP/cert-mgr.jsp)

In function ***sub_1791C*** ,***v27*** compose ***passwd*** with other text. And then system will execute that.

```
sprintf(
  v27,
  "openssl pkcs12 -chain -CAfile %s -in %s -inkey %s -export -out %s -password %s",
  "/tmp/cas.crt",
  "/etc/certs/me.crt",
  "/tmp/me.key",
  "/tmp/me.p12",
  passwd);
logtrace_log(7, 0, "CMD,%s", v27);
v22 = system(v27);
```

We can see that the var ***passwd*** is from ***pass:***

```
strlcpy(passwd, "pass:", 128);
v15 = fopen("/etc/export.key", "r");
if ( v15 )
{
  while ( fgets(export_key, 128, v15) )
    ;
  fclose(v15);
}
if ( export_key[0] )
  strcat(passwd, export_key);
v30 = "openssl";
v31 = "rsa";
v32 = "-in";
v37 = "/tmp/me.key";
v36 = "-out";
v33 = "/etc/certs/me.key";
v34 = "-passin";
v35 = passwd;
v38 = 0;
```

PoC:

We can try this ***password*** on the front-end, which would create a file namd ggg in /var/tmp/memory

Let's check it!

The export.key is ***&ps>>/var/tmp/memory/ggg***

```
/var/tmp/memory # cat /etc/export.key
&ps>>/var/tmp/memory/ggg/var/tmp/memory #
```

And the contents of ggg as following:
