```

V14 Obtains the data transferred by the front end through GET

Then the program copied the data into V27 after splitting the "/" data several times .

Then through

Sprintf (v24, "echo appId:%s versionId:%s path:%s fileName:%s > / TMP /download", V26, v27, (const char *) V8, V20);

This line of functions copies the data into the V24 array, and again executes directly with System
