The rce vulnerability is caused by the code reading the value from the yaml file and splicing it directly into the os.system statement.

1696             if pattern != 'jsvar':
1697                 logger.info('Running GF for {}'.format(pattern))
1698                 gf_output_file_path = '{0}/gf_patterns_{1}.txt'.format(
1699                     results_dir, pattern)
1700                 gf_command = 'cat {0}/{3} | gf {1} | grep -Eo {4} >> {2} '.format(
1701                     results_dir,
1702                     pattern,
1703                     gf_output_file_path,
1704                     output_file_name,
1705                     valid_url_of_domain_regex
1706                 )
1707                 logger.info(gf_command)
1708                 os.system(gf_command)
```

=====

If you try to reproduce the vulnerability, add the command you want to execute in the scan engine template in the background, then create a target and select the scan engine template for scanning. After a while, you will find that the command is successfully executed.
