There is a Persistent XSS vulnerability which allows remote attackers to inject arbitrary web script or HTML via the imgurl parameter of /admin.php?c=content&a=edit.

POC

```
<img src=1 onerror=alert(/xss/)>
```

Vulnerability trigger point

<http://test.com:8888/admin.php?c=content&a=add>. When attacker access -system settings - all content - add. Write poc in statcode form which framed with red line and then save the form. Then the content will be save and the article will be published.

Then view the article webpage named test-xss in home page , XSS vulnerability is triggered successfully.
