

3.1.1.5.3.1.1.2 dNSHostName

Article • 03/30/2020 2 minutes to read

The [object](#) has class [computer](#) or [server](#) (or a subclass of computer or server).

In [AD DS](#), the value of the [dNSHostName attribute](#) being written is in the following format: *computerName.fullDomainDnsName*, where *computerName* is the current [sAMAccountName](#) of the object (without the final "\$" character), and the *fullDomainDnsName* is the [DNS name](#) of the [domain NC](#) or one of the values of [msDS-AllowedDNSSuffixes](#) on the domain NC (if any) where the object that is being modified is located.

The requester must have the [Validated-DNS-Host-Name](#) validated write right.
