```

1  #!/usr/bin/python3
2  # CVE-2020-10547
3  # author https://github.com/theguly/
4  #
5  # this method is very similar to one already published by v1kingfr for his CVE-2020-10220 (https://github.com/v1kingfr/exploits-rconfig)
6  # as he published, because of PDO DB Class SNAFU, you could also stack two queries having a plain INSERT and achieve auth bypass by creating a new user
7  #
8  # i wanted to have different py script foreach CVE, to have a proper listing on github.
9  # i'd prefer a all-in-one script with proper align for the different union arguments, but i expect i won't use this script anymore so i'll deal with it.
10 #
11 # tested with rConfig < 3.9.6
