Plugin Description:

This plugin will help you to set up a contact form with captcha and checkbox. Plugin can be used SMTP (Simple Mail Transfer Protocol) to send mail.

- ability to create multiple contact forms
- standart or smtp ways to send mail
- ability to send to multiple addresses
- on/off captcha with salt
- additional simple spam protection (hidden input)
- on/off checkbox
- translation into other languages
- alternative fildes (you can create form elements, ability to send attachments)
- save fields contents if incorrect input
- substituting the senders email in the "from" field

- Standard PHP mail sending is enabled by default. Alternative fields are disabled by default. Captcha uses cookies.
- The plugin can be translated into other languages. See /lang/en.php, ru.php ... Make your translation and upload the "xx.php" file to the directory - /lang/ - then select your language file in the plugin settings. Do not use 'id', 'name' attribute for alternative fields.
- SMTP tested with @yandex.ru, @mail.ru, @gmail.com (ssl://smtp.yandex.ru | ssl://smtp.mail.com | ssl://smtp.gmail.com | port: 465). Should work with other, but I have not tested. To send from @gmail.com you need to click "ON" here: <https://www.google.com/settings/security/lesssecureapps>
- The settings are stored in the plugin directory, when you update the plugin you need to enter your data again.

Install Instructions:

Unzip and place file in the plugin folder of GetSimple. Then activate the plugin.

Create a contact form, select it and set the desired configuration. You can create multiple contact forms. For output, use a short-code or PHP-code that is automatically generated for each new contact form.

The short-code looks something like this:

```
[#GetMSC:auto_id#]
```

OR php-code:

Add this line of code to the template where you would like to display the contact form. Or create a component and paste this code into it.

```
<?php if (function_exists('GetMSC')) { print GetMSC('auto_id'); } ?>
```

If you create a component and paste plugin code into it and you would like a component to be displayed on only one page, that can be done by adding the following code to your theme's template.php file:

```
<?php if (return_page_slug()=='PAGE') get_component('COMPNAME'); ?>
```

Don't forget to replace PAGE with your page's slug and COMPNAME with the component's name.

Then go to the plugin settings.
