3      ----[ Qubes Security Bulletin 068 ]-----
4
5              2021-06-04
6
7
8      Disconnecting a video output can cause XScreenSaver to crash
9
10
11      User action required
12      =====
13
14      Users must install the following specific packages in order to address
15      the issues discussed in this bulletin:
16
17      For Qubes 4.0, in dom0:
18      - xscreensaver 5.45-5
19
20      For Qubes 4.1, in dom0:
21      - xscreensaver 5.45-5
22
23      These packages will migrate from the security-testing repository to the
24      current (stable) repository over the next two weeks after being tested
25      by the community. [1] Once available, the packages are to be installed
26      via the Qubes Update Tool or its command-line equivalents. [2]
27
28      After installing this update, the XScreenSaver daemon process must be
29      restarted in order for the changes to take effect. This can be done by
30      restarting dom0, logging out of dom0 then logging back in, or issuing
31      the following command in a dom0 terminal:
32
33      xscreensaver-command -exit; xscreensaver &
34
35
36      Summary
37      =====
38
39      XScreenSaver is the default screen locker in dom0. It tracks which video
40      outputs are connected to the system in order to blank them properly. In
41      some specific hardware configurations, disconnecting an output can cause
42      XScreenSaver to crash, leaving the screen unlocked.
43
44      Impact
45      =====
46
47      On hardware configurations with more than 10 video outputs that can be
48      disconnected, an attacker with physical access to a screen-locked system
49      may be able to unlock it by physically disconnecting one or more
50      outputs, bypassing standard screen lock authentication.
51
52      Details
53      =====
54
55      On X11, screen locking and blanking is done by creating a window that
56      obscures the whole screen, which is a standard practice. In
57      XScreenSaver, each such window is assigned a specific property. When a
58      video output is disconnected, its corresponding blanking window is
59      destroyed, and its XScreenSaver-specific property is removed so that it
60      will not be used by 'xscreensaver-command' anymore. This is handled by
61      the 'update_screen_layout()' function in the 'driver/screens.c' file:
62
63      985 /* Synchronize the contents of si->ssi to the current state of the monitors.
64      986      Doesn't change anything if nothing has changed; otherwise, alters and
65      987      reuses existing saver_screen_info structs as much as possible.
66      988      Returns True if anything changed.
67      989 */
68      990 Bool
69      991 update_screen_layout (saver_info *si)
70      992 {
71      993     monitor **monitors = scan_monitors (si);
72      994     int count = 0;
73      995     int good_count = 0;
74      ...
75      1009 while (monitors[count])
76      1010 {
77      1011     if (monitors[count]->sanity == S_SANE)
78      1012         good_count++;
```

```

79     1013     count++;
80     1014 }
81     1015
82     1016 if (si->ssi_count == 0)
83     1017 {
84     1018     si->ssi_count = 10;
85     1019     si->screens = (saver_screen_info *)
86     1020         calloc (sizeof(*si->screens), si->ssi_count);
87     1021 }
88     1022
89     1023 if (si->ssi_count <= good_count)
90     1024 {
91     1025     si->ssi_count = good_count + 10;
92     1026     si->screens = (saver_screen_info *)
93     1027         realloc (si->screens, sizeof(*si->screens) * si->ssi_count);
94     1028     memset (si->screens + si->nscreens, 0,
95     1029         sizeof(*si->screens) * (si->ssi_count - si->nscreens));
96     1030 }
97     ...
98     1092 for (; j < count; j++)
99     1093 {
100     1094     saver_screen_info *ssi = &si->screens[j];
101     1095     if (!ssi->screensaver_window)
102     1096         continue;
103     1097     fprintf (stderr, "%s: %d: screen now unused, disabling.\n",
104     1098         blurb(), j);
105     1099     /* Undo store_saver_id() so that xscreensaver-command doesn't attempt
106     1100         to communicate with us through this window. It might make more
107     1101         sense to destroy the window, but I'm not 100% sure that there are
108     1102         no outstanding grabs on it that have yet been transferred.
109     1103         */
110     1104     XDeleteProperty (si->dpy, ssi->screensaver_window,
111     1105         XA_SCREENSAVER_VERSION);
112     1106 }
113
114 The initial portion of the function counts how many outputs are defined
115 (the 'count' variable) and how many of them are connected (the
116 'good_count' variable). Then, the 'si->screens' array is allocated or
117 re-allocated to fit information about connected outputs, with an extra
118 margin of 10 entries. However, the loop at the end iterates over the
119 array up to the total number of outputs, not just the ones that are
120 connected.
121
122 If there are 10 or fewer disconnected outputs, this works fine. However,
123 if there are more than 10, it will access the array beyond its end,
124 reading unrelated data from memory. It will interpret this data as an
125 XScreenSaver window ID. If that unrelated data happens to be non-zero
126 (which is very likely), then the condition at line 1095 will not skip
127 it, and the 'XDeleteProperty' call will operate on that (most likely
128 invalid) window ID. This, in turn, will cause the XScreenSaver process
129 to crash, as that's what the error handler is programmed to do (the
130 'saver_ehandler()' function in the 'driver/xscreensaver.c' file).
131
132 The error message will look like this:
133
134 #####
135
136 xscreensaver: 11:17:59: X Error! PLEASE REPORT THIS BUG.
137 xscreensaver: 11:17:59: screen 0/0: 0x2ae, 0x0, 0x600001
138 xscreensaver: 11:17:59: screen 0/1: 0x2ae, 0x0, 0x0
139
140 #####
141
142 X Error of failed request: BadWindow (invalid Window parameter)
143 Major opcode of failed request: 19 (X_DeleteProperty)
144 Resource id in failed request: 0x188dba0
145 Serial number of failed request: 4284
146 Current serial number in output stream: 4286
147
148 #####
149
150
151 The issue affects only XScreenSaver version 5.45. Versions 5.44 and
152 older, as well as 6.00, are not affected. The XScreenSaver author was
153 notified about this issue and decided not to publish an advisory, as the
154 issue does not affect the most recent version.
155
156 The Qubes Security Team has decided to address this issue in Qubes OS by
157 patching this specific bug rather than immediately upgrading to the 6.00
158 version. The reason is that XScreenSaver 6.00 is a major update with
159 major architectural changes. As such, it poses an increased risk of
160 introducing unrelated problems. However, this decision does not preclude
161 the possibility of updating to XScreenSaver 6.00 at some point in the
162 future, independently of this particular security patch.
163
