TALOS-2021-1254

IOBit Advanced SystemCare ultimate privileged I/O write vulnerabilities

JULY 7, 2021

CVE NUMBER

CVE-2021-21787, CVE-2021-21788, CVE-2021-21789

Summary

A privilege escalation vulnerability exists in the way IObit Advanced SystemCare Ultimate 14.2.0.220 driver handles Privileged I/O write requests. A specially crafted I/O request packet (IRP) can lead to privileged writes which can result in elevation of privileges of the current user. A local attacker can send a malicious IRP to trigger this vulnerability.

Tested Versions

IObit Advanced SystemCare Ultimate 14.2.0.220

Product URLs

<https://www.iobit.com/>

CVSSv3 Score

8.8 - CVSS:3.0/AV:L/AC:L/PR:L/UI:N/S:C/C:H/I:H/A:H

CWE

CWE-782 - Exposed IOCTL with Insufficient Access Control

Details

IObit Advanced SystemCare Ultimate provides a solution for keeping track of running services, processes that are using a large amount of memory, software updates, and the ability to update drivers to latest versions.

Advanced SystemCare also provides a monitoring driver to help facilitate its tasks. This driver creates \Device\IOBIT_WinRing0_1_3_0 which is readable and writable to everyone. The driver also provides a callback for handling IRP_MJ_DEVICE_CONTROL requests to the driver.

The driver used in this analysis is below:

Monitor_win10_x64.sys e4a7da2cf59a4a21fc42b611df1d59cae75051925a7ddf42bf216cc1a026eadb

CVE-2021-21787 - Exposed OUT byte

During IOCTL 0x9c40a0d8, the first dword passed in the input buffer is the device port to write to and the byte at offset 4 is the value to write via the OUT instruction. The OUT instruction can write one byte to the given I/O device port, potentially leading to escalated privileges of unprivileged users.

```
Monitor_win10_x64.sys+0x11310

u32_at_0 = *(_DWORD *)input_buffer_1;
switch ( ioctl )
{
    case 0x9C40A0D8:
        __outbyte(u32_at_0, *((_BYTE *)input_buffer_1 + 4));
        goto LABEL_64;
```

CVE-2021-21788 - Exposed OUT word

During IOCTL 0x9c40a0dc, the first dword passed in the input buffer is the device port to write to and the word at offset 4 is the value to write via the OUT instruction. The OUT instruction can write one byte to the given I/O device port, potentially leading to escalated privileges of unprivileged users.

```
Monitor_win10_x64.sys+0x11310

u32_at_0 = *(_DWORD *)input_buffer_1;
switch ( ioctl )
{
    ...
    case 0x9C40A0DC:
        __outword(u32_at_0, *((_WORD *)input_buffer_1 + 2));
        goto LABEL_64;
```

CVE-2021-21789 - Exposed OUT dword

During IOCTL 0x9c40a0e0, the first dword passed in the input buffer is the device port to write to and the dword at offset 4 is the value to write via the OUT instruction. The OUT instruction can write one byte to the given I/O device port, potentially leading to escalated privileges of unprivileged users.

```
Monitor_win10_x64.sys+0x11310

u32_at_0 = *(_DWORD *)input_buffer_1;
switch ( ioctl )
{
...
case 0x9C40A0E0:
    __outword(u32_at_0, *((_DWORD *)input_buffer_1 + 1));
    goto LABEL_64;
```

Exploit Proof of Concept

In combination with the exposed IN instruction, an unprivileged user can access PCI devices on the system.

```
Opening Device
File Handle: 0xa0
Dumping PCI devices
Device: 0x1237 Vendor: 0x8086
Device: 0x7090 Vendor: 0x8086
Device: 0x109e Vendor: 0x80ee
Device: 0x2668 Vendor: 0x8086
Device: 0x003f Vendor: 0x106b
Device: 0x7113 Vendor: 0x8086
Device: 0x2829 Vendor: 0x8086
```

Timeline

2021-03-10 - Follow up with vendor
2021-04-30 - 2nd follow up with vendor
2021-05-17 - 3rd follow up with vendor
2021-06-27 - Final follow up with vendor
2021-07-07 - Public release
