

Funcational bugs in password rechecking during registration related processes #530

Open peng-hui opened this issue on May 25, 2020 · 0 comments

WeBid 1.2.2 has the problem of password rechecking during registration because it uses a loose comparison to check the identicalness of two passwords. Two non-identical passwords can still bypass the check. `$password1 = "0e1111"` and `$password2 = "0e2222"` are loosely compared and return `bool(true)`. A lot of other PHP scripts in WeBid also have this problem.
