## Open redirect in ck.php and lg.php

Share:     

### TIMELINE

mbeccati submitted a report to [Revive Adserver](#).

Jan 19th (2 years ago)

An opportunity for open redirects has been available by design since the early versions of Revive Adserver's predecessors in the impression and click tracking scripts to allow third party ad servers to track such metrics when delivering ads. Historically the display advertising industry has considered that to be a feature, not a real vulnerability.

The lg.php and ck.php delivery scripts are subject to open redirect via either dest, oadest and/or ct0 parameters.

### Impact

Users seeing a trustworthy domain could be redirected to a malicious URL without realising.

— mbeccati closed the report and changed the status to **Resolved**.

Jan 19th (2 years ago)

— mbeccati requested to disclose this report.

Jan 19th (2 years ago)

— erikgeurts [Revive Adserver staff](#) agreed to disclose this report.

Jan 20th (2 years ago)

— This report has been disclosed.
