

confirmUserID() function looks safe, still a type juggling one, but I think again not exploitable so I'll move on.

```
66
67
68 + confirmUserID - Checks whether or not the given
69 + username is in the database. If so it checks if the
70 + email exists in the same table in the database.
71 + For that user, if the user doesn't exist or if the
72 + email one is null or is, returns the error code
73 + (1 or 2). On success it returns 0.

```

Anyway I think it could be possible to bypass login by abusing mt_rand() weakness, but we need some value to get the seed, therefore a valid account. Plus, we don't know if somebody has logged in using rememberme function. Still a vulnerability I'd fix, but not useful to me right now.

Will add this mt_rand() and a new type juggling to my notes, just in case.

Password reset

Back at [www/lib/crud/userprocess.php](#) to review procForgotPass() function, I see that she generates a 8chars string using mt_rand() again

```
570
571 + generateRandStr - Generates a string made up of randomized
572 + letters (lower and upper case) and digits, the length
573 + is a specified parameter.

```

Then she loads user information and sends an email with the new password.

I don't see any other weakness but mt_rand() usage, that would still need some valid value as far as I know, and a weak password generation (new password length is 8 chars). An attacker could try to bruteforce the password online, but it would generate a lot of noise, and the user would receive a notification for the change as soon as she checks her email. Again vulnerabilities I would fix, but again out of scope now.

Registration

The function in charge of registering new users is procRegister(), defined in file [www/lib/crud/userprocess.php](#).

What's really interesting here is the call at line 96: function register() is called with usual value (user, password, password confirm, email) plus an interesting one: ulevelid.

If you open file [classes/user/session.class.php](#) you can see that, after doing some sanity checks for username, password, and email (the regex looks not valid to me, but we don't care about it right now) the function addNewUser() is called with the same argument.

OK, it's not a LFI nor a Mysql injection here, it's a **command** one, but it doesn't matter. What matters here is that the dev was aware of the vulnerability and tried to patch (note: this was part of what vikingfr discovered earlier, but I didn't know this because I tried to avoid as much spoil as possible). Because you should **never** trust patches, you should also review commit when you find messages like this.

And this is the case of a incomplete fix: we still have two unescaped variable taken from the GET and passed to the exec call, both \$searchTerm and \$grepNumLineStr are used with no sanitization.

```
08 // Search for all instances of the hash here using the supplied word.
09 // If the word is found, the hash is added to the list of hashes.

97 // If the word is found, the hash is added to the list of hashes.
98 // If the word is not found, the hash is not added to the list of hashes.
99 // If the word is found, the hash is added to the list of hashes.
100 // If the word is not found, the hash is not added to the list of hashes.
```

This of course leads to an easy RCE: the query can be done only by authorized users, doesn't matter by the level, but we already achieved auth bypass so we now are zero->admin->RCE.

NOTE: this vulnerability has been fixed in 3.9.6, please read [Update](#)

Because of the architecture of the app itself, it will be very easy to escalate to root, but I won't disclose any details here.

Sql Injection

I started this journey knowing I'm looking for a sql injection, but the time I gave myself for this exercise is almost over.

Rushing, I'll grep for SELECT/UPDATE/INSERT with a match on \$ to look for queries done with a variable. Of course it could be escaped before, but it's a good starting point (note: I have my own script that greps with a context, so I'm sure I won't miss multiline queries).

Suddenly four interesting files came out:

- [www/compliancepolicies.inc.php](#)
- [www/compliancepolicyelements.inc.php](#)
- [www/devices.inc.php](#)
- [www/snippets.inc.php](#)

Because the vulnerability is almost the same, I will discuss just the first one.

Vulnerable code looks like

```
10 // Search for all instances of the hash here using the supplied word.
11 // If the word is found, the hash is added to the list of hashes.
12 // If the word is not found, the hash is not added to the list of hashes.
13 // If the word is found, the hash is added to the list of hashes.
14 // If the word is not found, the hash is not added to the list of hashes.
15 // If the word is found, the hash is added to the list of hashes.
16 // If the word is not found, the hash is not added to the list of hashes.
17 // If the word is found, the hash is added to the list of hashes.
18 // If the word is not found, the hash is not added to the list of hashes.
19 // If the word is found, the hash is added to the list of hashes.
20 // If the word is not found, the hash is not added to the list of hashes.
21 // If the word is found, the hash is added to the list of hashes.
22 // If the word is not found, the hash is not added to the list of hashes.
23 // If the word is found, the hash is added to the list of hashes.
24 // If the word is not found, the hash is not added to the list of hashes.
25 // If the word is found, the hash is added to the list of hashes.
26 // If the word is not found, the hash is not added to the list of hashes.
27 // If the word is found, the hash is added to the list of hashes.
28 // If the word is not found, the hash is not added to the list of hashes.
29 // If the word is found, the hash is added to the list of hashes.
30 // If the word is not found, the hash is not added to the list of hashes.
31 // If the word is found, the hash is added to the list of hashes.
32 // If the word is not found, the hash is not added to the list of hashes.
33 // If the word is found, the hash is added to the list of hashes.
34 // If the word is not found, the hash is not added to the list of hashes.
35 // If the word is found, the hash is added to the list of hashes.
36 // If the word is not found, the hash is not added to the list of hashes.
37 // If the word is found, the hash is added to the list of hashes.
38 // If the word is not found, the hash is not added to the list of hashes.
39 // If the word is found, the hash is added to the list of hashes.
40 // If the word is not found, the hash is not added to the list of hashes.
41 // If the word is found, the hash is added to the list of hashes.
42 // If the word is not found, the hash is not added to the list of hashes.
43 // If the word is found, the hash is added to the list of hashes.
44 // If the word is not found, the hash is not added to the list of hashes.
45 // If the word is found, the hash is added to the list of hashes.
46 // If the word is not found, the hash is not added to the list of hashes.
47 // If the word is found, the hash is added to the list of hashes.
48 // If the word is not found, the hash is not added to the list of hashes.
49 // If the word is found, the hash is added to the list of hashes.
50 // If the word is not found, the hash is not added to the list of hashes.
51 // If the word is found, the hash is added to the list of hashes.
52 // If the word is not found, the hash is not added to the list of hashes.
53 // If the word is found, the hash is added to the list of hashes.
54 // If the word is not found, the hash is not added to the list of hashes.
55 // If the word is found, the hash is added to the list of hashes.
56 // If the word is not found, the hash is not added to the list of hashes.
57 // If the word is found, the hash is added to the list of hashes.
58 // If the word is not found, the hash is not added to the list of hashes.
59 // If the word is found, the hash is added to the list of hashes.
60 // If the word is not found, the hash is not added to the list of hashes.
61 // If the word is found, the hash is added to the list of hashes.
62 // If the word is not found, the hash is not added to the list of hashes.
63 // If the word is found, the hash is added to the list of hashes.
64 // If the word is not found, the hash is not added to the list of hashes.
65 // If the word is found, the hash is added to the list of hashes.
66 // If the word is not found, the hash is not added to the list of hashes.
67 // If the word is found, the hash is added to the list of hashes.
68 // If the word is not found, the hash is not added to the list of hashes.
69 // If the word is found, the hash is added to the list of hashes.
70 // If the word is not found, the hash is not added to the list of hashes.
71 // If the word is found, the hash is added to the list of hashes.
72 // If the word is not found, the hash is not added to the list of hashes.
73 // If the word is found, the hash is added to the list of hashes.
74 // If the word is not found, the hash is not added to the list of hashes.
75 // If the word is found, the hash is added to the list of hashes.
76 // If the word is not found, the hash is not added to the list of hashes.
77 // If the word is found, the hash is added to the list of hashes.
78 // If the word is not found, the hash is not added to the list of hashes.
79 // If the word is found, the hash is added to the list of hashes.
80 // If the word is not found, the hash is not added to the list of hashes.
81 // If the word is found, the hash is added to the list of hashes.
82 // If the word is not found, the hash is not added to the list of hashes.
83 // If the word is found, the hash is added to the list of hashes.
84 // If the word is not found, the hash is not added to the list of hashes.
85 // If the word is found, the hash is added to the list of hashes.
86 // If the word is not found, the hash is not added to the list of hashes.
87 // If the word is found, the hash is added to the list of hashes.
88 // If the word is not found, the hash is not added to the list of hashes.
89 // If the word is found, the hash is added to the list of hashes.
90 // If the word is not found, the hash is not added to the list of hashes.
91 // If the word is found, the hash is added to the list of hashes.
92 // If the word is not found, the hash is not added to the list of hashes.
93 // If the word is found, the hash is added to the list of hashes.
94 // If the word is not found, the hash is not added to the list of hashes.
95 // If the word is found, the hash is added to the list of hashes.
96 // If the word is not found, the hash is not added to the list of hashes.
97 // If the word is found, the hash is added to the list of hashes.
98 // If the word is not found, the hash is not added to the list of hashes.
99 // If the word is found, the hash is added to the list of hashes.
100 // If the word is not found, the hash is not added to the list of hashes.
```

As you can see, \$searchColumn is not escaped nor used as param in a prepared statement nor the query uses parameters. This will be an easy sql injection.

Looking at the file itself, we know that it's reachable from the webserver. Reading it from the beginning also shows that it can be used without authentication, leading to at least four pre-auth sql injection.

During a real engagement I would have it exploited to download IP/user/password of controlled devices (see rConfig website to see what she does and how a dump of the database could be useful to an attacker).

This could have huge impact on the network, because devices' data are encrypted with an hardcoded key.

I'd suggest the dev to encrypt IP/user/password of managed devices with a unique key, generated during rConfig setup, splitted between filesystem and database like Filippo Valsorda explain in his [blog](#) for hashing. This would make more difficult for an attacker to read both the part of the key and decrypt data.

This vulnerability has been assigned four CVEs, one foreach vulnerable endpoint: CVE-2020-10546 CVE-2020-10547 CVE-2020-10548 CVE-2020-10549.

NOTE: this vulnerability has been fixed in 3.9.7, please read [Update](#)

This attack is not over yet: if you notices that \$db2 handler, it pointed me to also review how that object is built and if it's abusable, and I think this will lead to another blog post about a stacked sql injection.

Conclusion

This could've been a good playground for OSWE preparation, not so complex and with some paths from zero to root by chaining multiple vulnerabilities.

I've not fully tested two RCE, and did not look for more "public" pages. There is still room for analysis, please ping me if you do some so we can share knowledge.

This journey also reminded me of a very very important thing: **never** trust a patch, always review because it's partial/incomplete or maybe introduced more bugs.

Updates

Stephen Stack, lead dev of rConfig, was kind enough to follow up with a fix for some of the reported vulnerabilities with version 3.9.6 and hoply in 3.9.7 later.
