Authorization Bypass: A Cautionary Tale CVE (2020-11679, 2020-11680, 2020-11681)

Author: Aaron Bishop

monitors illuminating the Guy Fawkes mask that conceals their face. In reality, however, most applications have the vast majority of their functionality (and potential attack surface) behind the login page where the "known" users roam. What if the feared "unknown attacker" truns out to be a trusted, authenticated, "known" user? Maybe the "unknown attacker" registered for the application or compromised a valid account and now has access. Is the sensitive functionality properly restricted from these "known" users as well?

For example, can low-privileged users browse directly to functionality that should be reserved for higher-privileged roles? Hiding elements with "CSS" or "HTML" comments or not including links in the navbar may be convenient for normal users but it does not provide security or proper access control which opens the door for abuse and attacks. Similarly, restricting "GET" requests can prevent users from viewing restricted information, but what about other HTTP methods? Are low-privileged users able to "POST" a form or "PUT" JSON thus allowing them to create objects or modify the state of the application?

So our story begins... during a penetration test, a valid, low-privileged user was able to perform actions that should have been restricted - including promoting their own account to admin.

## Authorization Bypass in a Penetration Test

I had access to two accounts: a low-privileged Reviewer and a high-privileged Administrator. The Reviewer had restricted access and could not browse to the functionality in the Administration tab that was visible from the Administrator role:

Browsing directly to the page is the simplest way to check if access controls exist but isn't the only option. For instance, I wondered how the application would respond if I called Administrator functionality that used another method, like the following POST request to modify my user roles:

```
POST /Administration/Users/Edit/:ID HTTP/1.1
Host: SRMST
User-Agent: Mozilla/5.0 (XII; Linux x86_64; rv:52.0) Gecko/28108101 Firefox/52.0

Naccept: text/Ital,application/Atmal.xml,application/xml;q=0.9,*/*;q=0.8

Accept-Language: en-US_en:q=0.5

Accept-Language: en-US_en:q=0.5

Accept-Language: gzip, deflate
Condel: SRV/IBMR_COCKIES

DW: 1

Connection: close
Upgrade-Insecure-Requests: 1

Connecti-Or: [ose
Content-Lenguis: 340

User-Id-:ID&Emall=bypassK40Test.com&FirstName=bypass&LastName=bypass&LDAPUser=false

NolestSOMSYO. Noleid-1880lostSOMSYO. Isselected-true&RolestSOMSO. Isselected-false

NolestSOMSYO. Noleid-1880lostSOMSOD. Isselected-true&RolestSOMSOD. Isselected-false

NolestSOMSYO. Noleid-1880lostSOMSOD. Isselected-false

NolestSOMSYO. Noleid-1880lostSOMSOD. Isselected-false

NolestSOMSYO. Noleid-1880lostSOMSOD. Isselected-false

NolestSOMSYOD. Noleid-1880lostSOMSOD. Isselected-false

NolestSOMSYOD. Noleid-1880lostSOMSOD. Isselected-false
```

Well  $\dots$  the application responded with the following error:

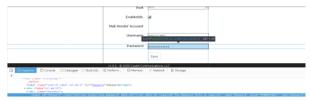

But the error was not a denial of access or due to insufficient privileges; it was a general error that had not appeared in the application before.

In the past I've come across applications that set permissions and access levels when a user authenticates, so I logged out, then logged back in and the Administrative functionality was now accessible.

As my low-privileged user I could directly call functionality provided by /Administration/Users to add the Administrator role to my account or I could create a new user with the Administrator role. (This issue was reported, resolved, and assigned CVE. 2020-11679)

I then used my escalated privileges to view pages that were previously restricted, pages such as /Administration/SMTP. I reviewed the source for /Administration/SMTP and noticed the credentials for the server were in the page:

Returning authentication credentials in the source of the application is a dangerous practice; if the page is cached or a malicious user is able to bypass restrictions (likel did), the credentials would be disclosed and the account compromised. In this instance, the SMTP account could be abused to spoof messages, spam others, etc.. (This issue was reported, resolved, and assigned CVE-2020-11681)

Ir emoved the Administrator role from my accounts o it was, once again, low privilege and evaluated additional calls. I found that I could directly call the functionality of the following /Administration pages:

```
POST /Administration/Alerts/Create
POST /Administration/Alerts/Delete
POST /Administration/Archiving/Create
POST /Administration/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/Endemons/
```

I used the calls to modify the information in other accounts (like the account email), then forced password resets, and finally

Low-privileged users could directly call functionality intended only for users with the Administrator role; the ability to bypass authorization was reported, resolved, and assigned CVE-2020-11680.

## Conclusion

My user was "trusted", but my actions should not have been. I was able to directly call functionality that should have been restricted; promoted my own role to Administrator and retrieved credentials for another host. If an "unknown attacker" in a Guy Fawkes mask compromised a user account they could have, from there, moved on to admin and the extent of damage caused could have been catastrophic.

Review OWASP Proactive Controls, Be proactive. Protect your application, even if it is from your own "known" and "trusted"
