TIMELINE

hnjhacking submitted a report to Keybase.

hhijhacking submitted a report to Keybase.

Ouring research, I had noticed that Keybase does not adequately clear the cache and some residual files can be viewed, with no form of encryption on the files. In addition, these pasted photos remain even after clearing the containing chat. Not all of the pasted photos remain, so it's unclear what makes some stay within the pasted photos remain, so it's unclear what makes some stay within the pasted photos remain, so it's unclear what makes some stay within the pasted photos remain, so it's unclear what makes some stay within the pasted photos remain, so it's unclear what makes some stay within the pasted photos remain, so it's unclear what makes some stay within the pasted photos remain and the pasted photos remains a pastedcache while others are effectively cleared.

I haven't seen any CVE identifier, so I have requested a CVE-ID from MITRE.

Replication

- 1. On a Windows machine, navigate to C:\Users\yourusername\AppData\Local\Keybase\uploadtemps
- $2. \ Note that some directories remain and that inside of the directories, you may find that some files are here, particularly image pastes. \\ keybase.png (F1150615)$ kb1.png (F1150618)

Impact

This is problematic because Keybase is supposed to be privacy centric. An attacker that gains access to a victim machine can potentially obtain sensitive data through the privacy centric. The problematic because Keybase is supposed to be privacy centric. The problematic because Keybase is supposed to be privacy centric. The problematic because Keybase is supposed to be privacy centric. The problematic because the pthrough gathered photos, especially if the user utilizes Keybase frequently. A user, believing that they are sending photos that can be cleared later, may not realize that occasionally pasted photos are not cleared from the cache and may send photos of credentials, etc, to friends or may even send other sensitive data. The photos then the cache and may send photos of credentials, etc, to friends or may even send other sensitive data. The photos then the cache and may send photos of credentials, etc, to friends or may even send other sensitive data. The photos then the cache and may send photos of credentials, etc, to friends or may even send other sensitive data. The photos of credentials are cache and may send photos of credentials are cache and may send photos of credentials. The photos of credentials are cache and may send photos of credentials are cache and cache and may send photos of credentials are cache and cacan be stored insecurely on a case-by-case basis.
