Assignees internal bug tracker mw usb Labels III stm32cube-mcu-fw-dashb... Milestone 中 v1.10.0

TheSilentDawn commented on Oct 14, 2020

Describe the set-up

- Software:
 - o STM32Cube MCU & MPU Packages
- Version:
 - o STM32Cube_FW_H7_V1.8.0
- · Verification Hardware Platform:
 - o STM32H7B3

Describe the bug

- Function:
 - ${\color{red} \bullet} \quad \text{static USBH_StatusTypeDef USBH_MSC_InterfaceInit(USBH_HandleTypeDef *phost)}$
- - o From line 180 to line 200 in

- - O Denial-of-Service
- Result:
 - The system will hang when try to communicate with the endpoint.
- Description:
 - o The function USBH_MSC_InterfaceInit() inits the status of MSC handler. It initializes the IN endpoint and OUT endpoint as shown from line 180 to line 200 in $https://github.com/STMicroelectronics/STM32CubeH7/blob/79196b09acfb720589f58e93ccf956401b18a191/Middlewares/ST/STM32_USB_Host_Library/Class/MSC/Src/usbh_msc.c.$
 - o However, when the variable bEndpointAddress of endpoint descriptor are both masked as IN or OUT without checking as shown in

STM32CubeH7/Middlewares/ST/STM32_USB_Host_Library/Core/Src/usbh_ctlreq.c Line 468 in 79196b0 ep_descriptor->bEndpointAddress = *(uint8_t *)(buf + 2);

, the MSC handler will also only initialize the IN or OUT part as shown from line 180 to line 200 in

 $https://github.com/STMicroelectronics/STM32CubeH7/blob/79196b09acfb720589f58e93ccf956401b18a191/Middlewares/ST/STM32_USB_Host_Library/Class/MSC/Src/usbh_msc.c.$

- 1. Running MSC_Standalone application on the STM32H7B3I platform
- 2. Plug a USB disk
- 3. Use the attached Bug6.txt to replace the USB device packet.

Additional context

- To patch it, the program should check both IN and OUT pipe is constructed.
- [I] ALABSTM added this to To do in stm32cube-mcu-fw-dashboard on Oct 15, 2020
- A ALABSTM self-assigned this on Nov 2, 2020
- ALABSTM added the mw label on Nov 2, 2020

Hi @TheSilentDawn,

Thank you for this other report. To be sure I understood your point, please allow me these questions:

- We are dealing with the case of a simultaneously IN and OUT endpoint? This is what I understood from the expression "the variable bEndpointAddress of endpoint descriptor are both masked as
- We are requesting from the software to check both? This is what I understood from the expression "the program should check both IN and OUT pipe is constructed"

Thank you in advance for your clarifications.

Hi @ALABSTM, Yes, the firmware should open an IN pipe and an OUT pipe to communicate with a device normally. However, as the report described, the driver codes do two OUT pipes unexpectedly which will block the communication in the subsequent execution of the firmware. If anything not clear, please let me know. The property of the firmware is anything not clear, please let me know. The property of the firmware is anything not clear, please let me know. Hi @TheSilentDawn,	
Thank you for the clarification. Hence, the case you are describing is an interface exposing 2x IN endpoints or 2x OUT endpoints instead of 1x IN endpoint normal case for a MSC).	t and 1x OUT endpoint (which is the
I will forward your report to our development teams. I will get back to you as soon as they provide me with their feedback.

Hi @TheSilentDawn,	
Hope you're fine. Just to inform you the fix has been published in the frame of v1.10.0 release.
