X41 D-SEC GmbH Advisory: X41-2019-008

# Vulnerable Components in Cerner medico

Confirmed Affected Versions:

Confirmed Patched Versions: Defect 226386, Hotfix H26001200000

Vendor: Cerner Health Services Deutschland GmbH

Vendor URL: https://www.cerner.com

Vendor Reference: https://www.cerner.com/de/de/loesungen/medico

Vector: Adjacent Network

Credit: X41 D-SEC GmbH

Status: Public

CVE: CVE-2020-11674, CVE-2020-11675, CVE-2020-11676, CVE-2020-11677

CVSS Score:

CVSS Vector:
CVSS:3.0/AV:A/AC:L/PR:N/UI:N/S:U/C:L/I:L/A:L

# Summary and Impact

During a penetration test, a Cerner medico hospital information management system was discovered with numerous security issues. A process called \$lim\_proxy was observed to be running and istening on the network. Upon investigating this custom component, its socie was discovered with numerous security issues were discovered which, if reachable by an attacker, would allow the attacker to take complete control of the

### **Product Description**

The Cerner medico hospital information man

### Analysis

As part of the pentest, X41 copied a folder called BTMC containing the source files crypt., cpp, dpscrypt., cpm, ddsct.c.ntmkcr.c., and slim\_proxy.c., as well as compiled binaries or object files. Most of the files have copyright headers attributing Cerner. Since this is not the compiled software, no thorough audit was performed, and no documentation available, the relation between the tools is only partially known. Bugs in the argument parsing may only be exploitable by a local user, or may be triggerable through the network if called by another tool on the system in relative case, who bugs are considered to be indicated or the finish of mistakes the velociopes made.

Slim\_proxy.c contains a function shoulnode() which capies the result of iso2utf() into a buffer of 500 bytes. Since the result of iso2utf() can potentially be 1000 bytes long, this could result in a buffer overflow. The function refreshList() uses the variable compart without initialization, potentially be singing to data corruption.

opscrypt.c. also contains multiple buffer overflow vulnerabilities. Command line arguments as well as environment variables are copied into a fixed-length buffer using strcpy(). Since no length is given, the value may overflow the buffer. Furthermore, the purpose of this utility appears to be to encrypt passwords with the broken DES encryption algorithm. The file crypt.cpp contains an implementation of the broken DES encryption algorithm to facilitate this.

 $\textbf{ntmkcr.c} \ uses the \textit{variable} \ \textbf{opt\_string} \ as both source and destination of \textbf{sprintf()} in the function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption. The function \textbf{mod\_key\_opts()}, resulting in undefined behaviour and potential data corruption and potential data cor$ 

mkdict.chas a similar bug where the variable sbuff a used as both source and destination of sprintf() in the function mask\_tick(). It also contains a buffer overflow by copying an environment variable into a 30-byte buffer using strcpy() without any boundary checks. Data not excepted when writing a certain forms output fine for example in the function write; csvfile(), where values are written without excaping the held definite (semicolon, if any of the fields, would contain a semicolon, it would not not be an analysis of the fields. The code paulity overflaw is considered prior and should not be used in brande dast of which the confidentiality or in thingsing in semiconary finally many finally many forms of the fields. Support of the field would contain a semicolon, it was of the fields would contain a semicolon, it was of the field. The code paulity overflaw is considered by the field with a semicolon of the field would not be a finally as a semicolon of the field with a semicolon of the field would contain a semicolon, it was of the field. The code paulity overflaw is contained by the field with a semicolon of the field. The code paulity overflaw is contained by the field with a semicolon of the field. The code paulity overflaw is contained by the field would contain a semicolon of the field. The code paulity overflaw is contained by the field with a semicolon of the field. The code paulity overflaw is contained by the field with a semicolon of the field. The field with a semicolon of the field with a semicolon of the field. The field with a semicolon of the field wi

# Workarounds

Apply the patches to have the state of 2020-04-01. Timeline

2019-11-12 Issue found

2020-01-20 Customer of X41 grants permission to pass the advisory

2020-01-20 BSI contacted by X41

2020-01-22
BSI approved to take care of contacting the vendor and to notify affected hospitals

2020-02-04 Vendor released Defect 226385, Hotfix H26001102000 to miltigate issues in slim\_proxy.c 2020-02-25 Conference with Cerner BSI and X41

**2020-02-26** Vendor released Defect 226386, Hotfix H26001200000  ${\bf 2020 \cdot 04 \cdot 01}$  Vendor wrote in a statement regarding CVE registration that all risks have been remediated

 $\textbf{2020-04-06} \\ \textbf{X41} sent preliminary advisory to BSI with request to forward it to the vendor of the sent preliminary advisory to the sent present the sen$ 

2020-04-07 Vendor received preliminary advisory from BSI

2020-04-21 Vendor sent version numbers of the mitigations to BSI

2020-04-23 X41 released advisory

# About X41 D-SEC GmbH

X41 is an expert provider for application security services. Having extensive industry experience and expertise in the area of information security, a strong core security team of world class security experts enables X41 to perform premium security services.
