Affected version

V1.3.0.8

Vulnerability

The stack overfow vulnerability is in /usr/sbin/httpd. The vulnerability occurrs in the sub_5DE14 function, which can be accessed via the URL http://routerlogin.net/WLG_ap_dual_band.htm .

```
v20 = strcmp(v59, "enable_fixed_ip_setting");
       if (!v20)
  229
  230
         acosNvramConfig set((int)"ap dyn dns", (int)"0");
231
         sub_1A54C(a1, "apmode_dns1_pri", V54, 2048);
  232
         sub_1A54C(a1, "apmode_dns1_sec", v53, 2048);
  233
         v42 = strcmp(v53,
  234
235
         if (!v42)
  236
         {
           v44 = -2569;
237
238
           v43 = &v62;
  239
         if (!v42)
240
241
           LOBYTE(v43[v44]) = 0;
  242
         sprintf(s, "%s %s", v54, v53);
                                            vuln
         V41 = 5;
243
244
         goto LABEL 40;
  245
```

In this function, apmode_dns1_pri is controllable and will be passed into the v54 variable and v54 will be passed into stack s by sprintf. It is worth noting that there is no size check, which leads to a stack overflow vulnerability.

Also, apmode_dns1_sec is controllable and will be passed into the v53 variable and v53 will be passed into stack s by sprintf. It is worth noting that there is no size check, which leads to a stack overflow vulnerability.
