If users use cross-domain communication, attackers can create an iframe and listen to any messages sent from the app and also send messages to the app. This happens only in the same browser so this is low impact.

Example exploit, if you upload this file to any domain, you can intercept messages from http://jcubic.pl/sysend.php

```
sysend.proxy('http://jcubic.pl');
window.addEventListener('message', (e) => {
    console.log(e);
});
```
